

Starting the CLIC

- Please enter the CLIC folder (not the CLIC_# folder) and double-click on one of the following the files
« cliclin », or « cliclin64 »,
or « clicmac »,
« clicwin.cmd », or « clicwin64.cmd »,
depending on both your system (Linux, Mac or Windows) and the machine category (bit 32, or bit 64).

- Is it that simple ? The answer is NO, of course...

(1) For LINUX users

- Please do not forget to give « cliclin », or « cliclin64 », and also **etcl** (or **etcl64** if under a 64 bits system) the **permission to run as an executable** (...:~\$ *sudo chmod a+x etcl*). Note : **etcl** and **etcl64** are in the **CLIC_#** folder.

- Under the Unity interface of Ubuntu, you might need to install **gnome-commander**, and from there to double-click on « cliclin », or « cliclin64 »

(2) For WINDOWS users

32 or 64 bits, I recommend to make a **short-cut** of **clicwin.cmd** or **clicwin64.cmd** to be put on your desktop

(3) For MacOS users

In case of problem, you probably would need to give the status of an executable file to the following 3 files :

...CLIC/clicmac

.../CLIC/CLIC_#/mac

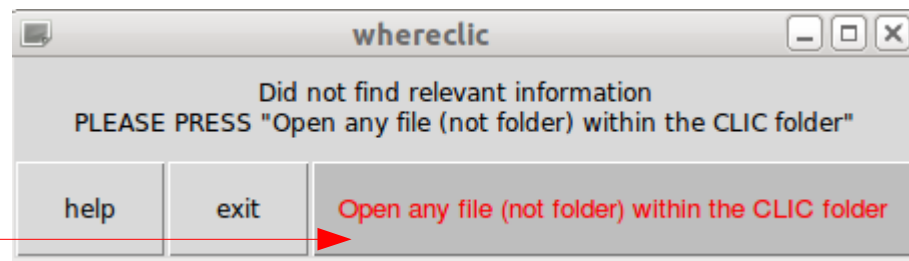

.../CLIC/CLIC_#/tclkitmac

To do so, please use the **Terminal**, go to the relevant folder, and write the relevant instruction, either *chmod +x clicmac*, *chmod +x mac*, or *chmod +x tclkitmac*

Note : On a 64 bits machine, COO might be unable to open images other than .gif formatted.
Please install ImageMagick software (more details inside COO)

First use of the CLIC (Linux, Windows)

- The very first time you open CLIC, the program asks a weird question, kind of: "*Where am I ?*".

Please **hit the red button** showing that question, and **navigate** through your hard disk; **enter the CLIC_# folder** (but you will probably be there immediately) and **open any file (file, not folder) by double-clicking**.

That's it.

(If the folder CLIC stays at the same place, this question is not going to bother you anymore. Otherwise, you will have to follow the recommendation that will appear: to delete a given (hidden) file (CLIC does it for you), and to open all over again.)

Good luck!
